

# Demonstration Overview

## Demonstration Scenario Sequence of Events

# Mobilization (Vignette 1)

Today, large amounts of useful information are being collected on the battlefield, but soldiers are not aware of it nor are they able to locate, access or visualize

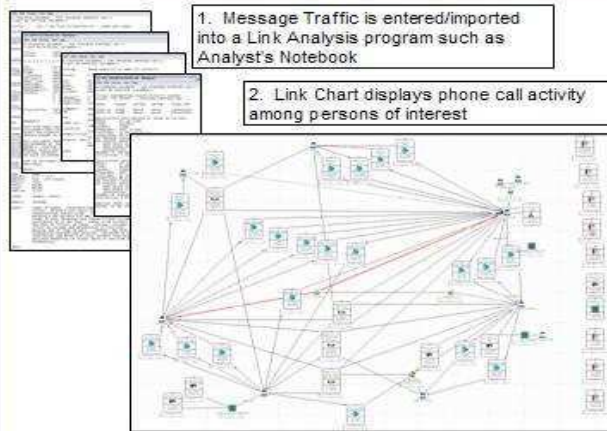

Seamless discovery of, access to, and visualization of geospatial information across the enterprise eliminates duplicative IPB efforts

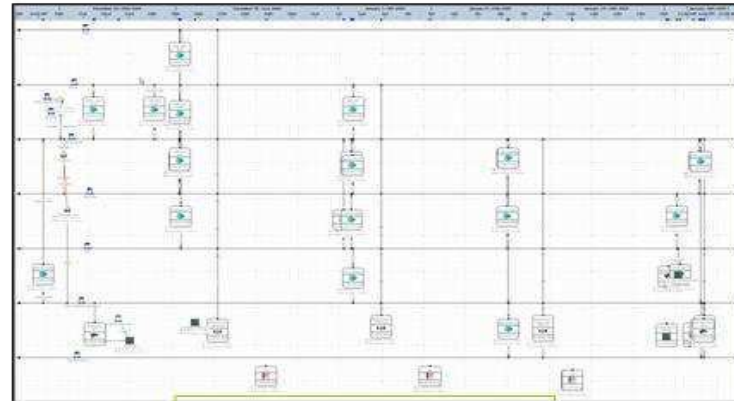

# Intelligence Gathering (Vignette 2)

Geospatial information is a key component of intelligence that is not being fully exploited

3. Timeline Chart presents the phone calls, meetings & incidents as events with links to the persons of interest. This format reveals temporal patterns and enables predictive analysis. This chart reveals a series of phone calls followed by a meeting followed by IED incidents).

## Geospatial Intelligence Data Analysis

5. The insurgents could be interdicted during the fourth set of actions when they again convened at the safe house.

4. Message Data imported into Analyst's Notebook can be transferred to ArcMap and displayed over high-resolution imagery

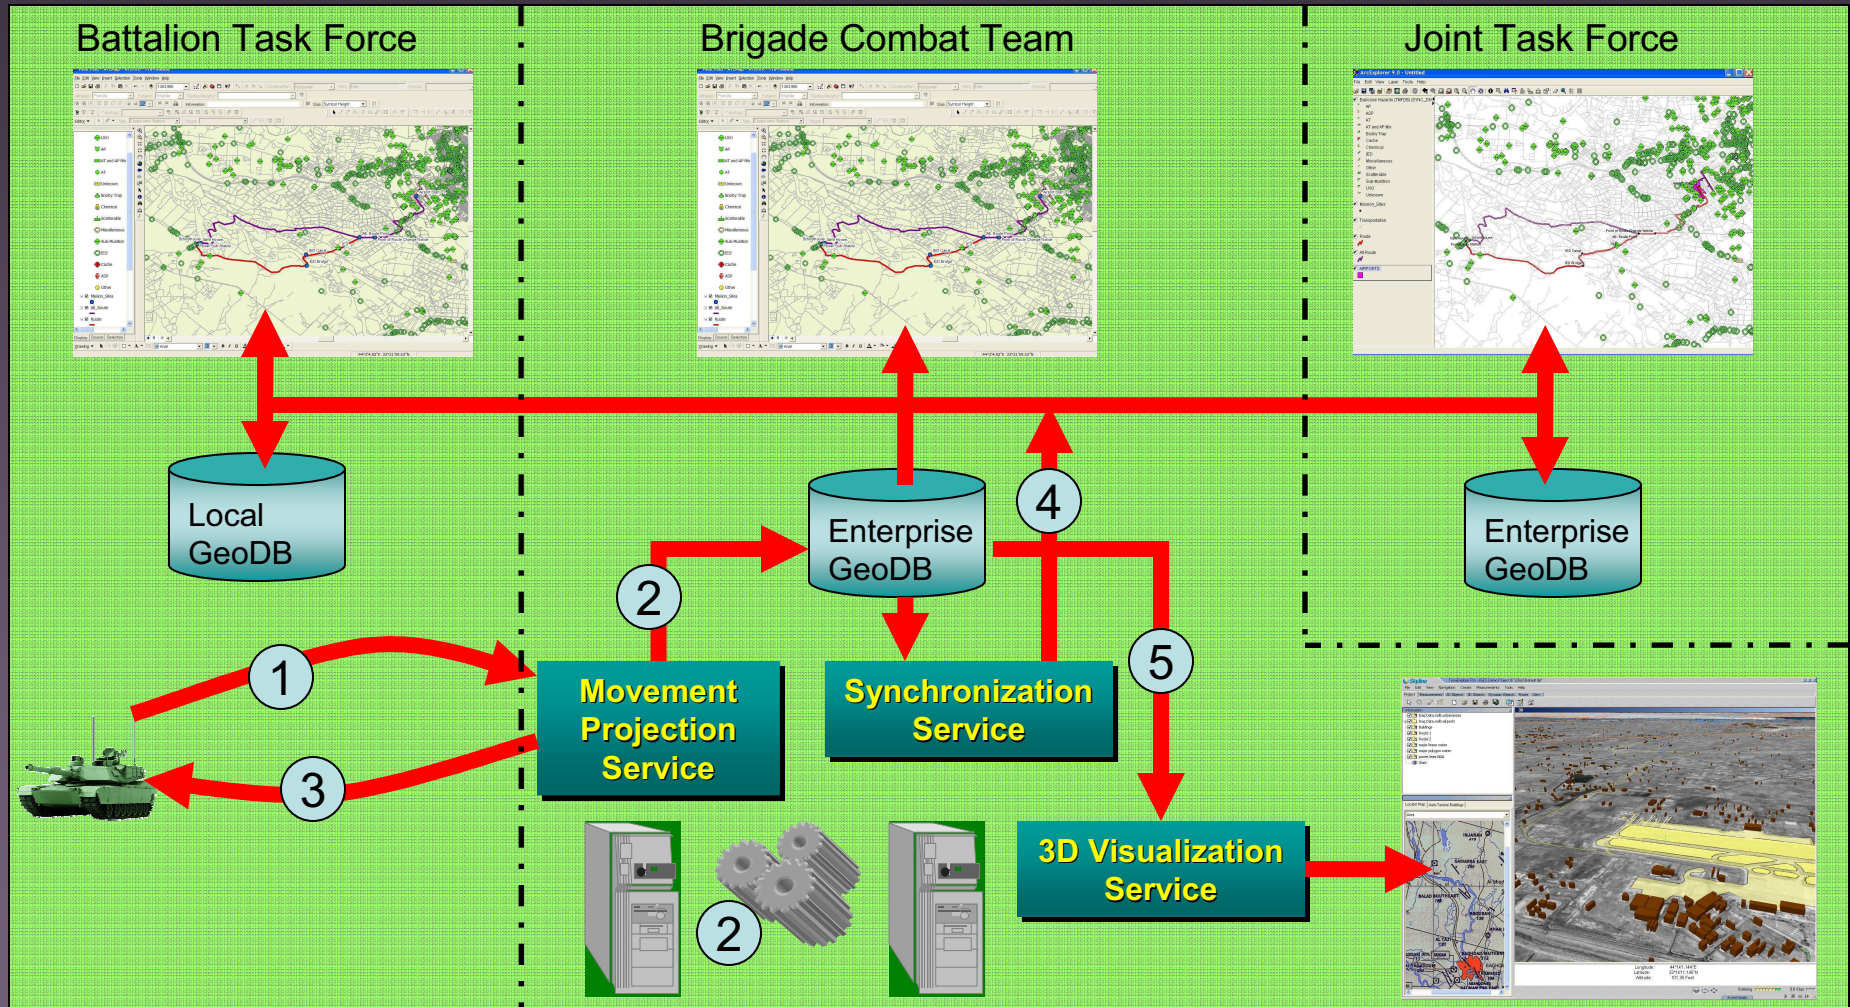

Visual geospatial information enhances actionable intelligence

# Mission Planning (Vignette 3)

Stovepiped systems and proprietary data formats inhibit interoperability

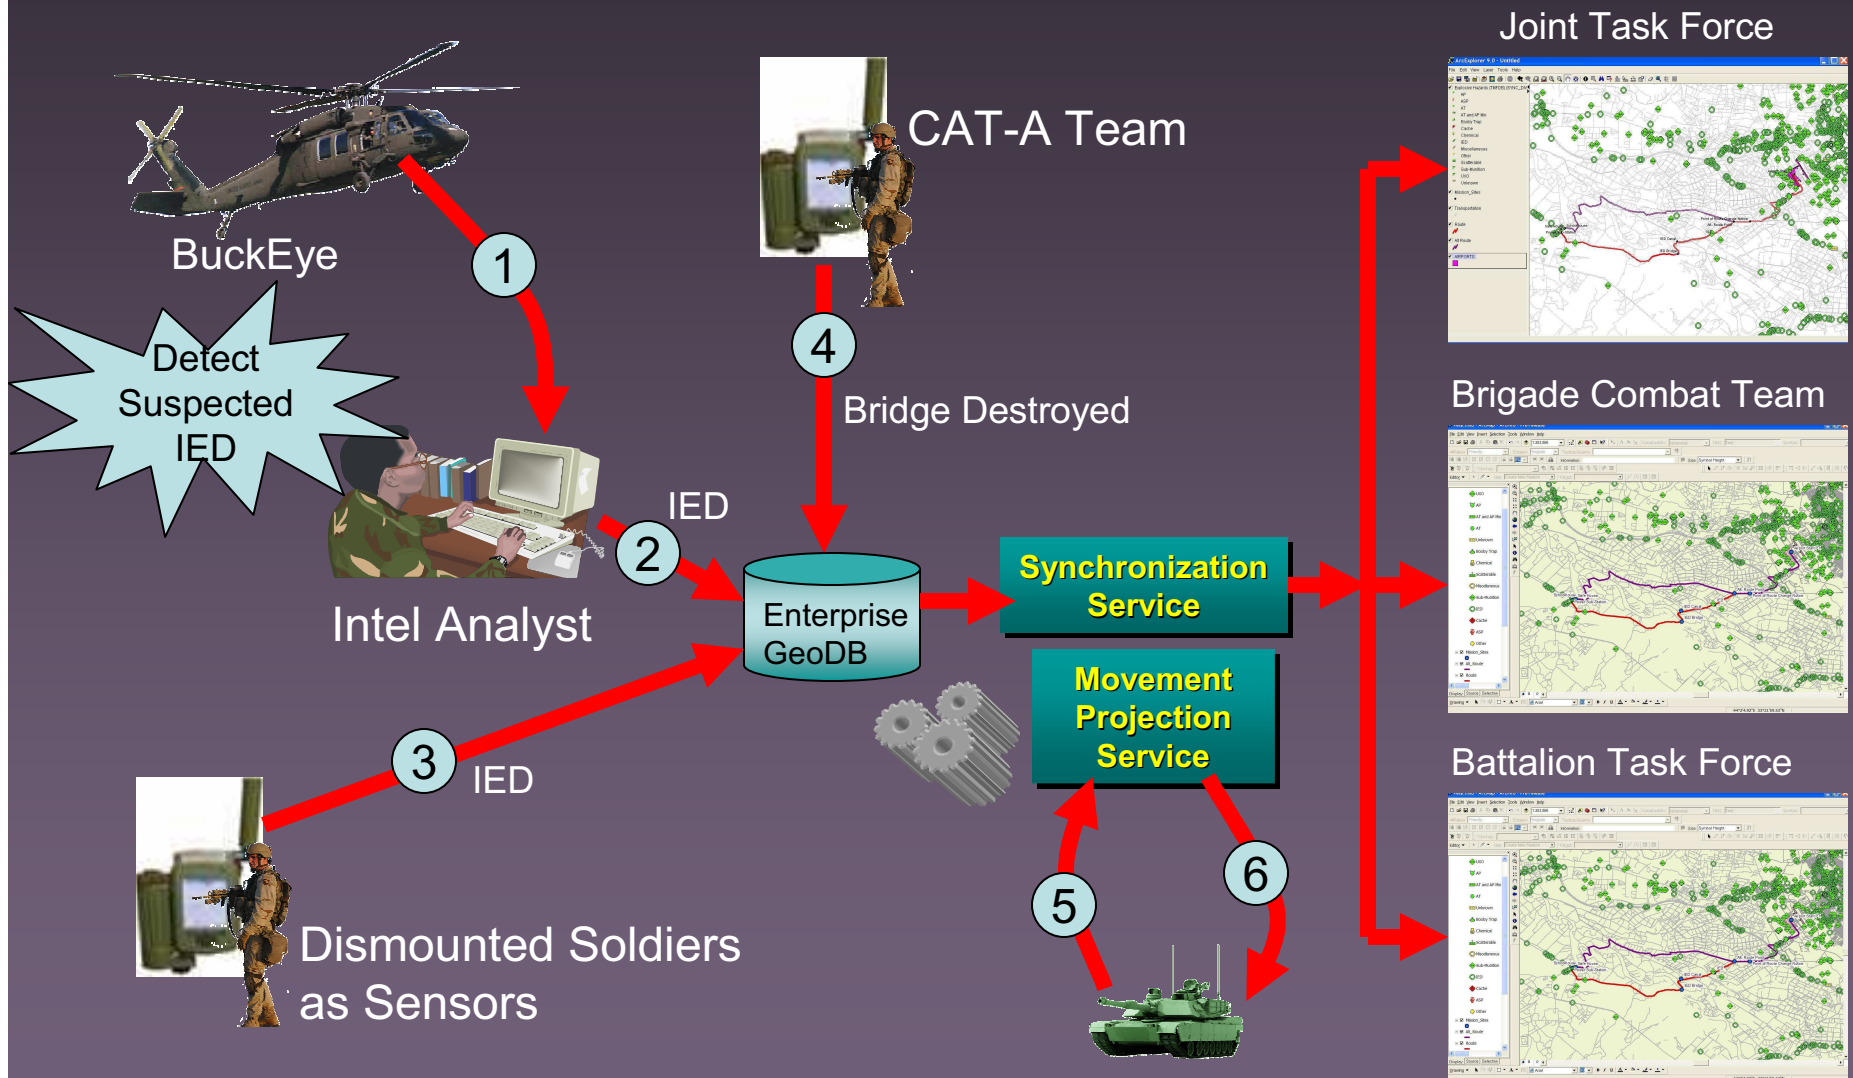

Enterprise Geospatial Services enhance collaborative planning and interoperability

# Assured Mobility (Vignette 4)

Soldiers currently do not receive timely geospatial information

Geospatial data collected and shared in near real-time improves situation understanding

# Direct Action (Vignette 5)

Soldiers lack the ability to obtain the latest intelligence once the mission begins

- 1) UAV flies over target area and sends real-time situation awareness on the objective to team lead
- 2) Team lead identifies building adjacent to suspected hideout as the correct target
- 3) Team lead repositions entry team to enter adjacent building and disseminates new positions to the team

Sharing real-time situation awareness at the edge improves mission effectivity

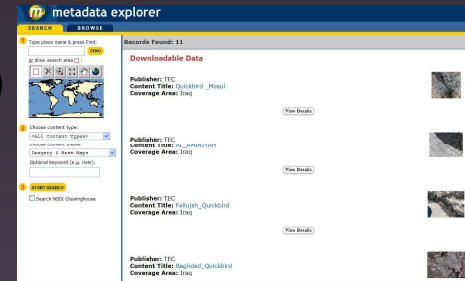

# Demonstration Summary

## 1. Discover data and services

- Enabled the analyst to find relevant data across echelons to develop the operational picture and improve situation awareness

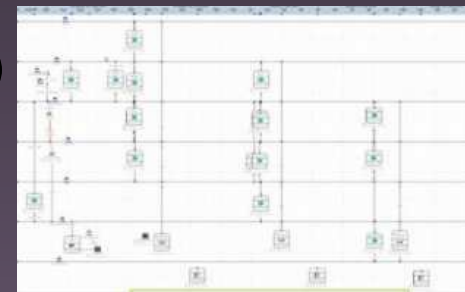

1

## 2. Temporal and geospatial information intensifies intelligence

- Tracking services help visualize events spatially

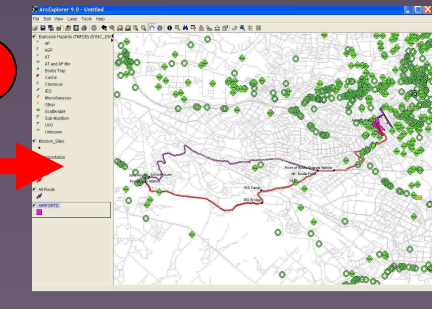

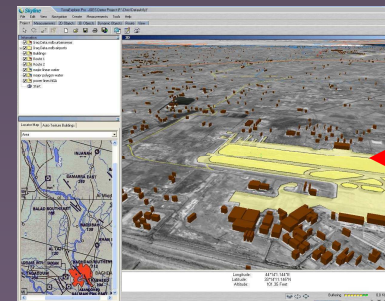

2

## 3. Geospatial data synchronization

- Enabled the commander to see near real-time geospatial planning and operational updates to improve his understanding of the battlespace

3

## 4. Soldier as sensor, information from/to the edge

- Integrate timely, local knowledge into common operational picture

4

5

## 5. Geospatial analytical services at the platform level

- Enabled the commander to make decisions regarding the safety of his troops in near real-time
